Esercizio Statistica 28/03/2019

Si consideri la spazio probabilizzato (R, B(R)) e sia data la seguente funzione $F(x) = c \cdot (x-1)^3$ per $1 \le x \le 4.5$. F(x) = 0 per $x \le 1$ e F(x) = 1 per $x \ge 4.5$

1-5: determini la costante c≥0 tale per cui F é una funzione di probabilità.

La funcione deve esseve continua a dertra:

$$\lim_{x\to 4.5} F(x) = F(4.5)$$

$$\lim_{X \to 4.5} c \cdot (x-1)^3 = 1$$

$$(3.5)^3 = 1$$

$$C = \frac{1}{(3.5)^3}$$

$$= \frac{8}{343} \approx 0.02332362$$

$$F(x) = \begin{cases} \frac{8}{343} (x-1)^3 & 1 \le x \le 4.5 \\ 0 & x \le 4.5 \\ 1 & x \ge 4.5 \end{cases}$$

2-Qual'é la probabilité dell'intervallo (-0.344,0.06]?

$$Pr((-0.344, 0.06]) = F(b) - F(a)$$

$$= F(0.06) - F(-0.344)$$

$$= 0 - 0 = 0$$

Determinare t in modo che l'intervallo (2.t] abbia probabilità 0.5

$$P_{V}((z,t)) = 0.5$$

$$F(t) - F(z) = 0.5$$

$$F(t) = 0.5 + F(z)$$

$$= 0.5 + \frac{8}{343} = \frac{8}{343} + \frac{5}{10}$$

$$= \frac{80 + 1715}{3430} = \frac{1795}{3430} = \frac{359}{686}$$

$$F(t) = \frac{359}{686}$$

$$C \cdot (x-1)^3 = \frac{359}{686}$$

$$\frac{8}{343} \cdot (x-1)^3 = \frac{359}{686}$$

$$(x-1)^3 = \frac{359}{686} \cdot \frac{343}{8}$$

$$= \frac{123137}{5488} = \frac{359}{46}$$

$$\sqrt[3]{(x-1)^3} = \sqrt[3]{\frac{359}{16}}$$

$$\chi(x-1)' = \chi \frac{557}{16}$$

$$\chi - 1 = \sqrt[3]{22.4375}$$

$$X-1 = 2.820492$$

$$X = 2.820492 + 1$$

$$= 3.820492$$

$$= 120441$$

$$= 31525$$

$$P_{V}((2,3.820492) = F(3.820492) - F(2)$$

$$= 0.5233238 - 0.0233236$$

$$= 0.5000002$$
