Quanto a lungo vive un certo organismo biologico, puó essere rappresentato da una variabile casuale (continua) X con funzione di densità di probabilità.

$$f(x) = 2\lambda x \cdot e^{-\lambda x^2} \qquad \lambda, x > 0$$

con
$$\lambda = 1.05$$

$$P_r(X \leq X) = \int_X f(x) dx$$

$$P_{Y}(X \le X) = \int (X \times X) dX$$

$$P_{Y}(X \le X) = \int (X \times X) dX = \int (X$$

2-Colcolore
$$P(0.66 \le X \le 1.18)$$

 $P_{Y}(0.66 \le X \le 1.18) = \int_{0.66}^{1.18} 2\lambda x \cdot e^{-\lambda x^{2}} dx = -e^{-\lambda x^{2}} \Big]_{0.66}^{1.18} = -0.2347676 + 0.6329398$
 $= 0.4011721$

Nomenti:

Ora si consideri una variabile casuale Y con funzione di densità figi = de ay y 20

3.1-Calcolave il momento non centrato di ordine 1 di Y:

$$E(X^{r}) = E(X^{1}) = \int_{0}^{+\infty} x \cdot \int_{0}^{+\infty} x \cdot \int_{0}^{+\infty} x \cdot dx$$

$$f(x) = x \qquad g(x) = \frac{e^{-x}x}{-x}$$

$$f(x) = 1 \qquad g'(x) = +e^{dx}$$

$$= x \left(\frac{-x e^{-dx}}{x} - \int_{0}^{+\infty} \frac{1 \cdot e^{-dx}}{x} dx \right)$$

$$= -x e^{-x} + \int_{0}^{+\infty} e^{-x} dx$$

$$= -x e^{-x} - \frac{1}{\alpha} \int_{0}^{+\infty} -e^{-x} dx$$

3.2 - Caladare il momento non centrato di ardine 2 di Y
